

## Assignment Part 4

Parts 1 / 2 of the assignment required you to build a web form to implement the student questionnaire. You should have a PHP response page which can insert a student response from the web page into a database table. Part 3 asked for the equivalent of CRUD functionality to be created for the lecturer and to generate some general statistics.

In class, you will have seen how to construct an authentication system. Create (and restructure your work) so that the lecturer pages are ONLY available to a properly authenticated lecturer. Students should be able to see the form to make an entry, lecturing staff should be able to login and use all the functionality from part 3.

Rather than simply printing the results out, the lecturer should be able to see the student results summarised in some way. Create this page using whatever statistics you deem appropriate.

This work should be submitted as a single Word document (electronically to a dropbox). Note the assignment web page has instructions about this process, along with how the document should be formatted.

Assessment parts				
	Forms, design and interface	Database	PHP Code	Report
↑ 70	Uses PHP in well defined functions to generate interface	Well designed	Well designed code, indented, semantic names, good functions	Well structured, TOC, screen shots, explanations etc
↑ 60	Uses PHP to generate form elements	Good attempts at efficient table structure	Some function use, where appropriate	Good structure, explanations
↑ 50	Uses CSS or tables where appropriate	Sensible names, reasonable structure	Appropriate layout, names and structure	Reasonable structure
↑ 40	Basic forms	Basic table structures	Basic PHP	Basic code and some explanations, structure and screen shots
